star begins its life as a cloud of gas and dust called a nebula Protostar As gravity pulls the gas and dust together it forms a protostar a hot dense core Main Sequence Star Once nuclear fusion begins in the core the star enters the main sequence stage where it spends most of its life Giant or Supergiant Star As the stars fuel begins to run out it expands into a giant or supergiant star White Dwarf Neutron Star or Black Hole The final stage of a stars life depends on its mass Small stars end as white dwarfs while massive stars may become neutron stars or black holes

5 Describe the different types of planets in our solar system and their key features Answer Our solar system is comprised of eight planets each with unique characteristics Inner Planets Terrestrial These planets are rocky and dense including Mercury Venus Earth and Mars They are relatively small and have a solid surface Outer Planets Gas Giants These planets are gaseous and massive including Jupiter Saturn Uranus and Neptune They have thick atmospheres composed primarily of hydrogen and 3 helium

6 Explain the concept of gravity and its role in shaping the solar system Answer Gravity is a fundamental force that attracts objects with mass It plays a crucial role in shaping and maintaining the solar system Formation Gravity drew together vast clouds of gas and dust leading to the formation of the sun and planets Orbital Motion Gravity keeps the planets in their orbits around the sun Tides Gravity from the moon and sun causes tides on Earth

7 What are the key differences between solar and lunar eclipses Answer Eclipses occur when one celestial body passes in front of another blocking its light Solar Eclipse Occurs when the moon passes between the sun and the Earth casting a shadow on Earth Lunar Eclipse Occurs when the Earth passes between the sun and the moon casting a shadow on the moon

8 Explain the concept of the Big Bang theory and its evidence Answer The Big Bang theory is the prevailing cosmological model describing the origin and evolution of the universe It states that the universe originated from an incredibly hot dense state about 13.8 billion years ago and has been expanding ever since Evidence Redshift of distant galaxies cosmic microwave background radiation abundance of light elements and the expansion of the universe

9 What are the major challenges facing space exploration and what are some potential solutions Answer Space exploration faces numerous challenges including Cost Launching spacecraft and conducting missions is extremely expensive Technological Limitations Current technologies have limitations regarding spacecraft speed and propulsion making longdistance travel difficult Human Health The harsh conditions of space can pose significant risks to astronauts health Potential Solutions Technological advancements Developing more efficient propulsion systems reusable spacecraft and advanced lifesupport technologies 4 International collaboration Sharing resources and expertise to reduce costs and accelerate progress Private investment Encouraging private companies to invest in space exploration

10 Describe the significance of the Hubble Space Telescope and its contributions to astronomy Answer The Hubble Space Telescope is a revolutionary instrument that has revolutionized our understanding of the universe Significance It has provided stunning images of distant galaxies nebulae and planets revealing the vastness and beauty of the cosmos Contributions It has helped measure the age and expansion rate of the universe observed the birth and death of stars and studied

the atmospheres of exoplanets

Conclusion The study of astronomy offers a profound journey of discovery revealing the wonders of the cosmos and prompting us to ponder our place within it As we delve into the mysteries of the universe we gain a deeper appreciation for the interconnectedness of all things and the boundless potential for exploration
