possible the author draws together in a single volume major topics in environmental and resource management that have traditionally been dispersed among several different books applied ecology starts with an analysis of our planet's basic natural resources energy water and soil it moves on to the management of biological resources fish grazing lands and forests and then to pest control and pollution finally the book tackles conservation and management of wild species and the restoration of ecological communities the second edition of this text has been radically redesigned and rewritten each chapter starts with a list of questions setting out the various fundamental problems to be considered interwoven with these practical problems is a clear explanation of the underlying basic science ecology studied at scales ranging from global landscape and ecosystem down to the population and individual and even their physiology and genetics the science is illustrated by examples from every major geographic area of the world this book is aimed primarily at undergraduate students taking courses in applied ecology environmental science environmental management and natural resources management the author has extensive experience as a university teacher like his lectures this book is scientifically rigorous yet clear and easy to understand draws together major topics in environmental and resource management usually dispersed over many separate books questions summaries and clearly structured chapters enhance usability emphasis on clarity and accessibility based on a proven and successful course

there are few books available that provide a good introduction to the methods and techniques for ecological research this book will be invaluable to lecturers teaching field courses and students undertaking project work in ecology each chapter will focus on an ecological technique it will have an introductory section that describes the ecological principles and theory this will then be followed by example applications these will focus on three most common habitats where teachers take students for fieldwork the seashore ponds and lakes fields and woodland gives specific worked examples from the main ecosystems used for undergraduate study seashore lakes ponds field and woodland only introductory text specifically focused on field techniques great how to guide that will show student exactly how to carry out each method only text to emphasise the principles behind the techniques taking a methods based approach rather than a taxonomic approach eg chapters split into population measures biodiversity measures species richness measures rather than methods for invertebrates methods for mammals methods for birds etc greater emphasis on the equipment involved how to make it where to buy it good references to further reading and advanced techniques
