this book engages the reader in a journey of discovery among three characters philosopher teacher and student

this volume resulted from the conference a celebration of algebraic geometry which was held at harvard university from august 25

28 2011 in honor of joe harris 60th birthday harris is famous around the world for his lively textbooks and enthusiastic teaching as well as for his seminal research contributions the articles are written in this spirit clear original engaging enlivened by examples and accessible to young mathematicians the articles in this volume focus on the moduli space of curves and more general varieties commutative algebra invariant theory enumerative geometry both classical and modern rationally connected and fano varieties hodge theory and abelian varieties and calabi yau and hyperkähler manifolds taken together they present a comprehensive view of the long frontier of current knowledge in algebraic geometry titles in this series are co published with the clay mathematics institute cambridge ma

originally published in 1950 this textbook studies projective geometry and provides a solid introduction to similar studies in space of more than two dimensions

interest in the study of geometry is currently enjoying a resurgence understandably so as the study of curves was once the playground of some very great mathematicians however many of the subject s more exciting aspects require a somewhat advanced mathematics background for the fun stuff to be accessible we need to offer students an introduction with modest prerequisites one that stimulates their interest and focuses on problem solving integrating parametric algebraic and projective curves into a single text geometry of curves offers students a unique approach that provides a mathematical structure for solving problems not just a catalog of theorems the author begins with the basics then takes students on a fascinating journey from conics higher algebraic and transcendental curves through the properties of parametric curves the classification of limaçons envelopes and finally to projective curves their relationship to algebraic curves and their application to asymptotes and boundedness the uniqueness of this treatment lies in its integration of the different types of curves its use of analytic methods and its generous number of examples exercises and illustrations the result is a practical text almost entirely self contained that not only imparts a deeper understanding of the theory but inspires a heightened appreciation of geometry and interest in more advanced studies
