an investigation was made to select a cab heating system suitable for maximum operator comfort in air temperatures to 40f and winds up to 15 knots previously design criteria had been based on air temperatures to 65 f but a detailed study of conditions at a typical coastal polar station showed that this extreme was not essential and that a 40 f temperature and 15 knot wind would be an adequate criterion 99 percent of the time tests showed that in temperatures to 40 f with winds to 15 knots a hot water heating system would comfortably heat weathertight cabs on equipment which uses liquid cooled engines provided the engine coolant was at or near its normal operating temperature range during two summer seasons at mcmurdo station hot water heating systems on a variety of construction equipment provided satisfactory cab heating for 80 percent of the operators in temperatures to 32 f and winds to 25 knots but the slow warm up of the cabs in air temperatures below 10 f was notable this deficiency may be overcome by controlling engine environments and by providing auxiliary circulating pumps for low temperature coolants in service testing is recommended author
