this work is a showcase for the integration of systems biology and bioinformatics tools algorithms and models for deciphering biological phenomena more specifically it integrates i prediction algorithms for identifying and characterizing molecular interactions ii structural modelling of molecule complexes iii network analysis approaches and iv mathematical modelling and simulation two comprehensive workflows are implemented for the analysis of collective target gene regulation by micrnas and for the prediction of cooperating micrna pairs and their mutual target genes in two case studies mechanisms of fine tuned target gene regulation are revealed for different cellular processes and the phenomenon of cooperative target regulation is identified as frequent mechanism of gene regulation in humans

it charts the course of the emerging discipline of integrative molecular biology from macromolecular sequences to a biological and theoretical perspective showing that novel integrative methodologies and paradigms are emerging at the confluence of such disciplines as computer science logic linguistics and mathematics

while the basic pattern of hominid evolution is well documented the recent evolutionary history of homo sapiens is less clear application of molecular genetics techniques has great potential for resolving issues over this period but as the complexity of such data increases the quantitative methods used for its analysis are becoming more important this phase is also one of the richest for biological and behavioural evidence derived from both fossils and archaeology the book will contain expository and state of the art research contributions from experts in these diverse areas covering data and its interpretation and experimental and analytical techniques

it is clear that many fascinating problems still remain to be addressed in parasite transmission modelling from better understanding of transmission processes and natural history of infection to investigating the impact of ecological and spatial scales climate change host immunity and social behaviour parasite host evolutionary dynamics and parasite community ecology on parasite transmission this book captures some of the advances made in recent years and provides indications of ways forward for addressing these questions by shedding light on developments in conceptual frameworks and modelling tools as well as the emergence of new data forms for aiding model construction testing and analysis another important advance has been the parallel development of robust computationally intensive statistical methods to allow model testing and parameterization by aiding the fitting of models to complex data this is an exciting area of work which we believe will broaden the scope of mathematical modelling in investigating parasite transmission processes in particular we expect this advance will now allow modellers to begin the successful development and analysis of mechanistically rich models of parasite transmission that will facilitate better integration of the variety of mechanisms increasingly recognized as important in simultaneously affecting transmission including abiotic processes trophic and evolutionary interactions movement in space and behaviour and even physiology of the individual we foresee a continuing bright future for using mathematical modelling to clarify parasite transmission dynamics and address problems related to effective parasite control ultimately through this improved application of models to research and management we expect that parasite

control would be an achievable goal bringing benefits to a vast number of our fellow human beings

this book brings together leading experts to provide an introduction to genetic epidemiology that begins with a primer in human molecular genetics through all the standard methods in population genetics and genetic epidemiology required for an adequate grounding in the field
