insects represent over half of the planet's biological diversity this popular textbook provides a comprehensive introduction to this extraordinary diversity and places entomology central to the theory and practice of evolutionary and ecological studies fully revised this fifth edition opens with a chapter concerning the popular side of insect studies including insects in citizen science zoos and butterfly houses and insects as food for humans and animals key features of insect structure function behaviour ecology and classification are integrated with appropriate molecular studies much of the book is organized around major biological themes living on the ground in water on plants in colonies and as predators parasites parasitoids and prey insects a strong evolutionary theme is maintained throughout there is major revision to the chapter on systematics and a new chapter insects in a changing world includes insect responses to and the consequences of both climate change and human assisted global alterations to distributions updated taxoboxes demonstrate topical issues and provide concise information on all aspects of each of the 28 major groupings orders of insects plus the three orders of non insect hexapods new boxes describe a worrying increase in insect threats to landscape and commercial trees including eucalypts palms and coffee and explain the value of genetic data including evolutionary developmental biology and dna barcoding in insect

biodiversity studies the authors maintain the clarity and conciseness of earlier editions and extend the profuse illustrations with new hand drawn figures over 50 colour photographs together with the informative text and an accompanying website with links to video clips appendices textboxes and further reading lists encourage a deeper scientific study of insects the book is intended as the principal text for students studying entomology as well as a reference text for undergraduate and graduate courses in the fields of ecology agriculture fisheries and forestry palaeontology zoology and medical and veterinary science

in his preface to early editions of this book the late dr a d imms said that he intended it to be an elementary account of entomology as a branch of general biology he had especially in mind the needs of university students of zoology and agriculture as well as those intending later to specialize in entomology and he suggested that the book might also interest teachers of advanced biology in schools these general aims and the balance between the different aspects of the subject have changed little in this and in our previous revision we have however tried to bring the present edition up to date on the lines of our revised tenth edition of imms general textbook of entomology published in 1977 the text has been entirely re set and eleven illustrations have been replaced by new figures the same orders of insects are recognized as in the last edition but the sequence in which the endopterygote groups appear has been changed to reflect more accurately their probable evolutionary relationships many small changes and some additions have been made in the physiological sections the chapter on the origin and phylogeny of insects has been rewritten and a new bibliography provides a selection of modern references for the intending specialist it has been our object to make these alterations without materially increasing the length of the book or its level of difficulty

the present edition may be regarded as a descendant much changed and greatly enlarged of the late dr a d imms outlines of entomology first published in 1942 this went through three further editions without much change but after the death of the original author a fifth revised edition by professor o w richards and myself appeared in 1959 and a sixth in 1978 the book now appears in a considerably extended version in which i have tried to provide a more balanced introduction to the whole field of modern entomology by dealing with several aspects of the subject not discussed at all in previous editions thus in addition to innumerable lesser changes in the sections on insect structure function development classification and phylogeny i have completely recast the earlier chapter on some important modes of life in insects this now includes a far wider range of biological topics well exemplified by the insects and should i hope appeal not only to those already dedicated to entomology but also to others with more general biological interests a completely new chapter on the biology of insect populations has also been added and may serve to indicate the debt which modern ecological theory owes to work on insect populations it should hardly be necessary to apologize for introducing a certain amount of elementary mathematics into this account of a subject which is now among the most highly quantitative of biological disciplines

unlike some other reproductions of classic texts 1 we have not used ocr optical character recognition as this leads to bad quality books with introduced typos 2 in books where there are images such as portraits maps sketches etc we have endeavoured to keep the quality of these images so they represent accurately the original artefact although occasionally there may be certain imperfections with these old texts we feel they deserve to be made available for future generations to enjoy
