the genetic molecular and cellular mechanisms of neural development are essential for understanding evolution and disorders of neural systems recent advances in genetic molecular and cell biological methods have generated a massive increase in new information but there is a paucity of comprehensive and up to date syntheses references and historical perspectives on this important subject the comprehensive developmental neuroscience series is designed to fill this gap offering the most thorough coverage of this field on the market today and addressing all aspects of how the nervous system and its components develop particular attention is paid to the effects of abnormal development and on new psychiatric neurological treatments being developed based on our increased understanding of developmental mechanisms each volume in the series consists of review style articles that average 15 20pp and feature numerous illustrations and full references volume 1 offers 48 high level articles devoted mainly to patterning and cell type specification in the developing central and peripheral nervous systems series offers 144 articles for 2904 full color pages addressing ways in which the nervous system and its components develop features leading experts in various subfields as section editors and article authors all articles peer reviewed by section editors to ensure accuracy thoroughness and scholarship volume 1 sections include coverage of mechanisms which control regional specification regulate proliferation of neuronal progenitors and control differentiation and survival of specific neuronal subtypes and controlling development of non neural cells

the quantitative understanding of changes in cell types referred to as cell type transitions is fundamental to advance fields such as stem cell research immunology and cancer

therapies this thesis provides a mathematical modeling framework to simulate and analyze cell type transitions the novel methodological approaches and models presented here address diverse levels which are essential in this context gene regulatory network models represent the cell type determining gene expression dynamics here a novel construction method for gene regulatory network models is introduced which allows to transfer results from generic low dimensional to realistic high dimensional gene regulatory network models for populations of cells a generalized model class is proposed that accounts for multiple cell types division numbers and the full label distribution analysis and solution methods are presented for this new model class which cover common cell population experiments and allow to exploit the full information from data the modeling and analysis methods presented here connect formerly isolated approaches and thereby contribute to a holistic framework for the quantitative understanding of cell type transitions

the phenotype of a plant in response to a stress condition is the reflection of the molecular responses in different cell types composing the plant the multicellular complexity represents a challenge when accessing specific responses of each cell or cell type composing the plant to overcome this difficulty and allow the clear characterization of the plant cell molecular mechanisms the research community is now focusing on studying a single cell and single cell types the isolation of plant single cells is limited by the cell wall that confers the rigidity of the plant and its overall structure various methods have been developed for isolating plant cells e g laser capture microdissection cell sorting of green fluorescent protein gfp tagged protoplasts differential protoplastization of cells such as guard cells isolation of easily accessible cell types such as cotton fiber pollen cells trichomes and root hair cells the development of these innovative approaches to isolate single plant cells or cell types combined with the application of sensitive and high throughput technologies allows a better analysis of the developmental processes and response to environmental stresses ultimately single plant cell and cell type biology will lead to establishment of more reliable and accurate molecular regulatory networks at the resolution of basic life unit the goal of this research topic is to cover new technological and biological advances in the study of plant single cell cell type and systems biology
