this study evaluates research that provides an understanding about mathematical results which can be determined independently from contributing factors the relevance of the findings is important because there are many different reasons hypothesized by researchers as to why attention deficit disorder attentions deficit hyperactive disorder add adhd students may be experiencing mathematical

difficulties if there are accommodations made for these mathematical academic intervening issues then true mathematical difficulties can be addressed more specifically immediate intervention can be critical for students with add adhd because they are more likely to receive lower grades on standardized measures and academic subjects furthermore particular learning difficulties vaguely substantiate reports that state half of the regular classroom children with add adhd will experience school failure or fail one grade by adolescence and over one third will fail to finish high school however if an environment is created that is targeted at reducing add adhd students disruptive behaviors and a curriculum implemented that increases active engagement time on subjects for students then understanding and addressing their mathematical issues will become more accurate appended are 1 add adhd mathematical survey 2 graphs for add adhd mathematical survey and 3 human subject approval contains 10 tables

attention deficit hyperactivity disorder adhd is a prevalent neurodevelopmental disorder ndd that can impact various life domains children with adhd commonly exhibit difficulties within the academic domain it has been suggested that environmental factors such as those specific to the parent child relationship may be related to academic achievement outcomes for children with adhd however there exists a paucity of research regarding the effects of parenting factors e g parental involvement parenting style discipline practices on the academic achievement outcomes in children with differing severity of symptoms on the adhd symptom domains i e inattention hyperactivity impulsivity furthermore there is even less research regarding the effects of these parenting factors on performance in specific academic subjects for children with adhd math achievement is the focus of this thesis because some researchers have suggested that parenting factors differentially affect performance in math compared to reading in children with adhd although the relationships between parenting factors and math achievement have been explored for children who are typically developing it has recently been suggested that parent child relationship factors may impact children with adhd differently therefore research is needed on this topic including in relation to math parental involvement and discipline practices were examined in relation to math achievement for children with adhd using a pre existing database it was hypothesized that inattention would be negatively related to basic math performance but hyperactivity impulsivity was not parental involvement was expected to be curvilinearly related to basic math performance as were discipline practices confirmatory analyses revealed that hyperactivity was negatively related to basic math performance but inattention was not when basic reading ability was controlled neither parental involvement nor discipline practices were curvilinearly related to basic math performance when entered as the independent variable exploratory analyses were conducted to examine the relationships between parenting and basic math performance in reverse results of these analyses

indicated that basic math performance predicted discipline practices but not parental involvement exploratory analyses regarding the potential moderating effects of parenting factors on the relationships between adhd symptoms and basic math performance also were conducted along with other exploratory analyses parental involvement moderated the relationship between inattention and basic math performance but discipline practices did not furthermore working memory moderated the relationship between inattention and basic math performance but not the relationship between hyperactivity impulsivity and basic math performance visual spatial functioning did not moderate either relationship overall it appears that the relationships between parenting and basic math performance for children with varying levels of inattention are complex future research is needed to enhance our understanding of how parent child relationship factors relate to academic outcomes for children with adhd furthermore results in this area could be beneficial in determining appropriate targets for interventions i e environmental and non environmental aimed at improving academic outcomes for children with adhd

a useful guide with appealing graphic like illustrations for youth with adhd or for anyone seeking good study techniques booklist the homework squad is here for kids with adhd this easy to use guide will help with key study skills to improve reading writing math listening memorization concentration and more bite sized tips and tricks journal prompts and advice for challenges help kids with adhd recognize how they learn best and act on that knowledge this is an accessible straightforward and relatable guide to key study skills for kids with adhd that features a cast of characters with adhd to enliven the lessons the author covers an array of areas where kids with adhd might struggle academically to help kids recognize how they learn best and act on that knowledge

the difficulties children with adhd experience solving applied math problems i e word problems are well documented however the independent and or interactive contribution of cognitive processes underlying these difficulties is not fully understood and warrant scrutiny the current study examines two primary cognitive processes integral to children s ability to solve applied math problems working memory wm and math calculation ability i e the ability to utilize specific facts skills or processes related to basic math operations stored in long term memory thirty six boys with adhd combined presentation and 33 typically developing td boys aged 8 12 years old were administered multiple counterbalanced tasks to assess upper central executive ce and lower level phonological ph stm and visuospatial vs stm short term memory wm processes and standardized measures of mathematical abilities bias corrected bootstrapped mediation analyses revealed that ce ability fully mediated between group differences in applied problem solving whereas math calculation ability partially mediated the relation neither ph stm nor vs stm was a significant mediator when modeled together via serial mediation analysis ce in

tandem with math calculation ability fully mediated the relation explained 79 of the variance and provided a more parsimonious explication of adhd related deficits in applied math ability results suggest that interventions designed to address applied math difficulties in children with adhd will likely benefit from targeting basic knowledge of math facts and skills while simultaneously promoting the active interplay among these skills and ce processes

children with adhd frequently demonstrate deficits in working memory as well as across multiple domains of math skills working memory is a multi component system that includes a domain general central executive the working component of working memory and two domain specific storage subsystems phonological short term memory and visuospatial short term memory extant literature indicates a strong link between neurocognitive deficits in working memory and math skills however the extent to which each component of the working memory system may account for this relation is unclear the current study was the first to use bifactor s i 1 modeling to examine the relations between each working short term memory component id est central executive phonological short term memory and visuospatial short term memory adhd symptoms and math skills in a clinically evaluated sample of 186 children ages 8 13 mage 10 40 sd 1 49 69 9 white non hispanic 62 girls results of the structural equation model indicated that all three working short term memory components contribute significantly and approximately equally to children s math achievement beta 29 50 all p
