the aim of this book is to show how supramolecular complexity of  
cell organization can dramatically alter the functions of  
individual macromolecules within a cell the emergence of new  
functions which appear as a consequence of supramolecular  
complexity is explained in terms of physical chemistry the book  
is interdisciplinary at the border between cell biochemistry  
physics and physical chemistry this interdisciplinarity does not  
result in the use of physical techniques but from the use of  
physical concepts to study biological problems in the domain of  
complexity studies most works are purely theoretical or based on  
computer simulation the present book is partly theoretical partly  
experimental and theory is always based on experimental results  
moreover the book encompasses in a unified manner the dynamic  
aspects of many different biological fields ranging from dynamics  
to pattern emergence in a young embryo the volume puts emphasis  
on dynamic physical studies of biological events it also develops  
in a unified perspective this new interdisciplinary approach of  
various important problems of cell biology and chemistry ranging  
from enzyme dynamics to pattern formation during embryo  
development thus paving the way to what may become a central  
issue of future biology
