limited information about the demand for some of the resources needed to produce goods and services e.g. incomplete and imperfect bills of materials forces firms to use heuristics when planning resource capacity we examine the performance of five heuristics two drawn from practice two that modify observed approaches and one motivated by theory we measure performance as the ratio of the expected cost of supply demand mismatch from using a heuristic to the value in the full information solution numerical analysis shows that a simple heuristic that is common in practice plan rigorously for a few driver resources with high quality information and use ratios e.g. 0.25 indirect labor hours per machine hour to project the capacities for the remaining non driver resources is robust and efficient using more than one driver resource to plan for the same non driver resource delivers significant gains reducing measurement error with respect to the consumption of driver resources dominates the gain from reducing errors on other aspects indeed with high measurement error collecting information that reduces other sources of error could decrease overall performance finally a greedy algorithm of choosing the most expensive resources as drivers is optimal

in these days of shortened fiscal horizons and contracted time to market schedules traditional approaches to capacity planning are often seen by management as tending to inflate their production schedules rather than giving up in the face of this kind of relentless pressure to get things done faster guerrilla capacity planning facilitates rapid forecasting of capacity requirements based on the opportunistic use of whatever performance data and tools are available in such a way that management insight is expanded but their

schedules are not a key guerrilla concept is tactical planning whereby short range planning questions and projects are brought up in team meetings such that management is compelled to know the answer and therefore buys into capacity planning without recognizing it as such once you have your foot in the door capacity planning methods can be refined in an iterative cycle of improvement called the wheel of capacity planning another unique guerrilla tool is virtual load testing based on dr gunther s universal law of computational scaling which provides a highly cost effective method for assessing application scalability
