this book provides a far sighted perspective on the role of wearable and wireless systems for movement disorder evaluation such as parkinson s disease and essential tremor these observations are brought together in the application of quantified feedback for deep brain stimulation systems using the wireless accelerometer and gyroscope of a smartphone to determine tuning efficacy the perspective of the book ranges from the pioneering application of these devices such as the smartphone for quantifying parkinson s disease and essential tremor characteristics to the current state of the art dr lemoyne has published multiple first of their kind applications using smartphones to quantify movement disorder with associated extrapolation to portable media devices

the patient s guide to common neurological problems discussed in an interesting and easy to understand way headaches confusion dizziness memory loss sleep problems back pain weakness sex problems treatment options

in the united states an estimated 42 million people suffer from some form of movement disorder common movement disorders include parkinson s disease pd essential tremor et and dystonia although medications may be helpful for these conditions in many patients symptoms cannot be controlled with medications alone in such situations their physicians may recommend a surgical procedure known as deep brain stimulation dbs dbs is a revolutionary technology using an implanted device to deliver electrical stimulation to the brain to help symptoms alleviate suffering and improve quality of life the food and drug administration fda approved dbs as a treatment for essential tremor in 1997 for parkinson s disease in 2002 and dystonia in 2003 deep brain stimulation has dramatically changed the

lives of many patients with uncontrollable tremors patients often can resume normal activities such as feeding and dressing themselves and can have active and fulfilling lives the need for anti tremor medications is often reduced or eliminated though it s no longer considered experimental dbs is for now still used as a second or third line treatment reserved for patients with more advanced cases of the disease and those for whom medication alone is inadequate or can t be adjusted precisely enough to keep their tremors and writhing under control however the idea of this surgery being a last resort is an evolving concept ten years ago doctors were operating on only the most severe disabled wheelchair dependent patients now they are operating on patients with moderate to severe cases of pd et and dystonia the thought is that this trend will continue instead of saying wait another five to ten years until you become more disabled doctors are realizing that the earlier they use dbs the more they can improve the quality of life of their patients
