one hundred years ago electric cars were the most popular automobiles in the world in the late nineteenth century and at the start of the twentieth century they outsold every other

type of car and yet within a couple of decades of the start of the twentieth century the electric car had vanished thousands of battery powered cars disappeared from the streets replaced by the internal combustion engine and their place in the history of the automobile was quietly erased a century later electric cars are making a comeback fears over pollution and global warming have forced manufacturers to reconsider the electric concept a history of electric cars presents for the first time the full story of electric cars and their hybrid cousins it examines how and why electric cars failed the first time and why today's car manufacturers must learn the lessons of the past if they are to avoid repeating previous mistakes all over again the book examines in detail early vehicles such as the Lohner Porsche petrol electric hybrid of 1901 key figures in the history of the electric car development such as Henry Ford Sir Clive Sinclair's plans to build a number of electric vehicles designed to sit alongside the Sinclair C5 the return of the electric technology to vehicles as diverse as the NASA lunar rover commuting vehicles and supercars future developments in electric cars for the first time the full story of electric cars and their hybrids are examined the hidden past of the electric automobile is uncovered and its future developments are discussed superbly illustrated with 300 colour photographs many of which are rare and original sketch designs Nigel Burton has written and lectured on cars and automotive history for more than twenty years

the book provides a comprehensive analysis and evaluates the performances of existing and future transport systems the evaluation is mainly measured by the level of automation operating speed and greening effect the book reviews road based automated and electric cars rail based HSR high speed rail and maglev air based UAM urban air mobility and supersonic LH2 liquid hydrogen powered 2 SCAT supersonic commercial air transport and evacuated tube hyperloop and submerged ETT evacuated tube transport systems infrastructural technical operational economic environmental social and policy performances are analysed and the analytical models of indicators have been developed the models of indicators are applied using inputs from real life and hypothetical what if scenario based cases respecting the preferences of the main stakeholders involved such as drivers passengers transport operators policymakers and local regional national and global communities a SWOT analysis is applied to the qualitative evaluation of these systems indicating their potential advantages and disadvantages for the stakeholders involved

in the burdened scenes of everyday life our brains must select from among many competing inputs for perceptual synthesis so that only the most relevant receive full attention and irrelevant distracting information is suppressed at the same time we must remain responsive to salient events outside our current focus of attention and balancing these two processing modes is a fundamental task our brain constantly needs to solve both the physical saliency of a stimulus as well as top down predictions about imminent sensations crucially influence attentional selection and consequently the response to unexpected events research over recent decades has identified two separate brain networks involved in predictive top down control and reorientation to unattended events or oddball stimuli the dorsal and ventral fronto parietal attention systems of the human brain moreover specific electrophysiological brain responses are known to characterize attentional orienting as well as the processing of deviant stimuli however many key questions are outstanding what are the exact functional differences between these cortical attention systems how are they lateralised in the two hemispheres how do top down and bottom up signals interact to enable flexible attentional control how does structural damage to one system affect the functionality of the other in brain damaged patients are there sensory specific and supra modal attentional systems in the brain in addition to these questions it is now accepted that brain responses are not only affected by the saliency of external stimuli but also by our expectations about sensory inputs how these two influences are balanced and how predictions are formed in cortical networks or generated on the basis of experience dependent learning are intriguing issues in this research topic we aim to collect innovative contributions that shed further light on the cortical mechanisms of attentional control in the human brain in particular we would like to encourage submissions that investigate the behavioural correlates functional anatomy or electrophysiological markers of attentional selection and reorientation special emphasis will be given to studies investigating the context sensitivity of these attentional processes in relation to prior expectations trial history contextual cues or physical saliency we would like to encourage submissions employing different research methods psychophysical recordings neuroimaging techniques such as fmri meg eeg or ecog as well as neurostimulation methods such as tms or tdc in healthy volunteers or neurological patients computational models and animal studies are also welcome finally we also welcome submission of meta analyses and reviews articles that provide new insights into or conclusions about recent

work in the field
